"harmonic bridge, MASS MoCA, permanent collection

box3070, touring exhibition

tuning tube O+A The tuning tube generates a living overtone series in response to the sound environment around it. This shifting chord of perfectly tuned musical intervals is exported via a microphone placed at a harmonic node within the tube. Reintroduction of the harmonically tuned sound to the environment allows observers to hear this environment as musical information, thus reducing stress. Three aluminum tubes in lengths from 16 to 12 ft. are shown.
